Microbiological quality of bottled mineral water in Turkey. A study was carried out from March 1998 to November 1999 to determine the microbiological quality of bottled water in Turkey. A total of 360 samples of bottled water were taken from the different regions of the country. The most frequently found microorganisms in bottled waters were Pseudomonas (22%), followed by enterococci (10%), alkaliphilic bacteria (7%), yeasts (5%), fecal coliforms (5%), and Clostridium perfringens (4%). All the isolates were subjected to biochemical tests. A total of 25 strains which were isolated from 13 samples (3.8%) were found to be positive for Escherichia coli. This is the first report on microbiological data of bottled water in Turkey.

The Humpback Whales From
